

GitHub Integration

How to connect your repository, read project activity, and keep development work visible inside

ProjectHub

Who should read this guide

Best for development teams, leaders, and supervisors tracking repository progress.

What you will learn

- Connect the correct repository and understand what data appears in ProjectHub.
- Keep branches, commits, and pull requests aligned with team workflow.
- Make development progress easier to review during academic follow-up.

Recommended first actions

- Verify repository ownership and access permissions before connecting.
- Use clean branch names and meaningful pull request titles.
- Check integration activity regularly to confirm the workspace reflects real code progress.

Why this card matters

This PDF expands the help-center card into a practical reference so users can understand not only where a feature lives, but also how to use it in a real graduation-project workflow.

Professional guide

Role-aware structure

Action-focused tips

Detailed walkthrough and practical recommendations for using this ProjectHub card well.

What this card covers

The GitHub Integration card explains how source code activity becomes visible inside ProjectHub.

- It focuses on connecting repositories, understanding imported activity, and supporting review discussions.
- It helps teams avoid treating GitHub as separate from the rest of the project workflow.
- It gives supervisors a cleaner picture of code progress without leaving the platform.

Connection basics

A correct initial setup prevents broken visibility later.

- Connect the repository that matches the active team and project scope.
- Confirm that the account used for integration has the permissions the team expects.
- Review whether branches, pull requests, and commits appear after setup.

Using the integration well

Repository data becomes more useful when the team applies consistent conventions.

- Match branch names and pull requests to tasks or sprint goals where possible.
- Keep commits readable enough that supervisors can understand progress direction.
- Use review-friendly pull requests instead of large unstructured merges.

Common integration risks

These issues reduce trust in the workspace view of engineering progress.

- Connecting the wrong repository or a repository with shared unrelated work.
- Leaving branches unreviewed so project status becomes misleading.
- Relying on GitHub activity alone without linking it back to tasks and milestones.

Support note

Use this guide when repository activity exists but the team still struggles to translate it into visible academic progress.
